

What is CAB and who uses it?

Central Analysis Bureau (CAB) is the industry's leading source of motor carrier risk intelligence, used by insurance underwriters, agents, freight brokers, and motor carriers. CAB provides unmatched visibility into safety performance and fleet composition.

How do underwriters benefit from CAB?

With tools like the CAB Report®, BASICS Calculator™, and Monitoring services, underwriters can review inspection and crash history, model potential score changes, identify high-risk behavior, and improve portfolio performance through data-driven underwriting decisions.

How do agents and brokers benefit from CAB?

Agents and brokers use CAB to validate safety performance, strengthen submissions, and reduce friction with carriers. Tools such as Vehicle Lookup & VIN Decoding and the CAB Report® help them uncover risk factors and confirm carrier details.

How do freight brokers benefit from CAB?

Freight brokers rely on CAB to identify safe, reliable motor carriers for their loads. With access to the CAB Express Report®, brokers can screen carriers to ensure freight is moved safely and efficiently.

What makes CAB's data unique?

CAB aggregates safety, compliance, inspection, crash, financial, and operational data from trusted federal and commercial sources, then cleans, standardizes, and enhances it with proprietary analytics.

How often is CAB data updated?

CAB updates inspection, crash, and safety information as soon as new data becomes available from federal systems. Monitoring services deliver real-time alerts for changes to inspections, violations, operating status, and more.

What is the CAB Report®?

The CAB Report® consolidates everything you need to evaluate a carrier, inspections, violations, crashes, fleet size, financial indicators, cargo details, and safety alerts. It provides a complete, easy-to-interpret snapshot that supports faster risk analysis.

How can I access CAB?

CAB is available through a web platform designed for quick lookups, VIN-level insights, and real-time monitoring. Data is also available via an API that integrates directly into your underwriting, brokerage, or internal risk systems.
